Streptococcus pyogenes plasmin receptor (plr) gene, cor M95569.

M95569.1 GI:153762
plasmin binding protein; plasmin receptor.
Streptococcus pyogenes
Bacteria; Firmicutes; Lactobacillales; Streptococcace: Streptococcus.

1 (bases 1 to 1156)
Lottenberg, R., Broder, C.C., Boyle, M.D., Kain, S.J., Scland Curtiss, R. III.
Cloning, sequence analysis, and expression in Escheric streptococcal plasmin receptor

WPI; 2002-098051/13. P-PSDB; AAM50664.

ς. Ω Novel GapC multiple epitope fusion polypeptide comprising antigenic determinant of Streptococcus dysgalactiae, S. agalactiae, S. uberis, parauberis, or S. iniae GapC protein useful for treating mastitis in vertebrates.

Example 4; Fig 6A-C; 116pp; English.

The present sequence is that of a chimeric gene encoding a multiple epitope fusion protein (see AAM50664), designated PolyGap4, comprising the entire amino acid sequence of the Streptococcus dysgalactiae GapC plasmin binding protein in addition to unique amino acid sequences from the Streptococcus agalactiae GapC proteins.

The gapC gene sequences used to construct the chimeric gene were prepared by PCR amplification of selected polynucleotide sequences from the genomic gapC genes using the primers given in ABA91335-42. After assembly, the chimeric gene was inserted into plasmid pAA555. PolyGal4 is an example of novel GapC multiple epitope fusion proteins of the invention that comprise epitopes from 1 or more of S. dysgalactiae, S. garauberis, Streptococcus uberis and Streptococcus iniae (see AAMS0665-69). The multiple epitope fusion proteins are produced using claimed host-vector systems and used in claimed vaccines for treating or preventing a bacterial infection in a vertebrate, especially a streptococcal infection, and particularly mastitis. They are also used in claimed methods of detecting Streptococcus antibodies. The multiple epitope protein is capable of eliciting broad immunity against a variety of streptococcal infections while minimising the number of antigens present in the final formulation and concomitantly reducing production costs.                                                                                                    vertebrates
                                                                                                                                                                  Example
```

The present sequence is that of the coding region of the gene encoding the GapC plasmin binding protein, DysGapC (see AAM50665), of the GapC plasmin binding protein, DysGapC (see AAM50665), of streptococcus dysgalactiae ATCC 43078, an isolate from a case of bovine mastitis. The gene was obtained by PCR amplification of chromosomal DNA using the primers given in ABA9133-34. The invention relates to novel GapC multiple epitope fusion proteins that comprise epitopes from 1 or more of Streptococcus dysgalactiae, Streptococcus agalactiae, Streptococcus agalactiae, Streptococcus iniae (see AAM50665-69). A claimed example is PolyGap4 (see AAM50664). The multiple epitope fusion proteins are produced using claimed host-vector systems and used in claimed vaccines for treating or preventing a bacterial infection in a vertebrate, especially a streptococcal infection in a vertebrate, especially a streptococcal infections while minimising the number of antigens present in the final formulation and concomitantly reducing production costs

Novel isolated GapC protein of Streptococcus dysgalactiae, S.agalactiae, S.uberis, S.parauberis, or S.iniae, useful as vaccine component for treating streptococcal infection which causes mastitis in vertebrates.

1; Fig 1A-B; 107pp; English Example

The present sequence is that of the coding region of the GapC plasmin binding protein gene of Streptococcus dysgalactiae ATCC 43078, a clinical isolate from a case of bovine mastitis. The gene was amplified from chromosomal DNA by PCR using the primers given in ABA91253 and ABA91254. The pcr product was cloned into expression vector pET15N, creating capable of eliciting an immune response in a vertebrate. The invention provides the GapC plasmin binding proteins of 5 treptococcus species, as well as recombinant vectors, host cells and vaccine compositions comprising GapC polynucleotides or proteins. The streptococcal infection, and mastitis in particular (claimed). A streptococcal infection, and mastitis in sused in a claimed method of treating or preventing a bacterial infection, such as a streptococcal infection, infection, such as a streptococcal infection.

The invention relates to an isolated nucleic acid comprising any one of the 6213 antisense sequences given in the specification where expression of the nucleic acid inhibites proliferation of a cell. Also included are:

(1) a vector comprising a promoter operably linked to the nucleic acid containing the vector; (3) an isolated on polypeptide whose expression is inhibited by the antisense nucleic acid; (2) a host cell containing the vector; (3) an isolated oplypeptide, (5) producing the polypeptide; (6) inhibiting cellular proliferation or the activity of a gene in an operon required for proliferation, (7) identifying a compound that influence the activity of identifying a compound that influence the biological pathway in which a proliferation or that has an activity against a biological pathway in which a proliferation required for cellular proliferation or the biological pathway in which the test compound that inhibits proliferation of an organism acts; (9) manufacturing an antibiotic; (10) profiling a compound; a civity; (11) a culture comprising strains in which the test compound that inhibits proliferation of an organism. The antisense nucleic acids are useful for relating proteins or severable for homologous nucleic acids required for cellular proliferation to isolate candidate molecules for rational drug discovery programs, or for screening for homologous nucleic acids required for cellular proliferation to isolate candidate molecules for retional drug discovery programs, or for screening homologous nucleic acids required for proliferation to isolate candidate molecules for retional drug discovery programs, or for screening homologous nucleic acids required for proliferation to isolate candidate molecules for retional companies. Note: The sequence is one of the target of companies of the printed specification, but was obtained in clear sequences. The sequence is one of the target of the printed specification, but was obtained in the printed port sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            screening
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Zyskind JW;

This sequence encodes the S. pyogenes plasmin receptor. This sequence was isolated from the S. pyogenes clinical isolate 64/14. The plasmin receptor has a very high affinity for plasmin which, when bound, retains its enzymatic activity but is not regulated (inhibited) by alpha-2-antiplasmin. The receptor protein, when administered concurrently or sequentially, prolongs the activity of plasminogen activator (PA) so allows a reduction in dose, and thus lowers the risk of bleeding, and may prevent reocclusion of blood vessels. The protein may be coupled to a fibrin-specific monoclonal antibody to provide targetting to clots. The plasmin receptor may be useful in human or veterinary medicine, for treatment of thrombosis and pulmonary embolism, and for solubilising clots in catheters or shunts.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  694
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                874
                                                                                                                        Polynucleotide sequence AAC66140 encodes the Streptococcal plasmin receptor protein AAY85681. The protein is used in a method for raising immune response in a mammal. The method comprises administering the plasmin receptor protein. The method is useful as a vaccination against group A Streptococcal infections and potentially against a broad range infections associated with pathogens expressing glyceraldehyde-3-phosphate dehydrogenase (GAPDH) or GAPDH-like proteins at their cell surfaces. The vaccine has antibacterial and antihelminthic activity

The invention relates to a protein (ABP25413-ABP30895) from group B streptococcus/GBS (Streptococcus agalactiae) or group A streptococcus/GAS (Streptococcus pyogenes), comprising one of 5483 sequences (S1), given in the specification. The proteins have antibacterial and antiinflammatory activity. (I), nucleic acids encoding (I), ABN66044-ABN71526 and antibodies that bind (I) are used in the manufacture of medicaments for the treatment or prevention of infection or disease caused by Streptococcus bacteria, particularly S. agalactiae and S. pyrogenes. (I) are used to detect Streptococcus in a bological sample. (I) is used to determine whether a compound binds to (I). A composition comprising (I) or a nucleic acid encoding (I), may be used to recombinantly produce (I) and may be used in gene therapy. Antibodies to (I) are used for affinity chromatography, immunoassays, and distinguishing/identifying streptococcus proteins
                                                                                                                                                                                                                                                                                                                     galactiae;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to a protein (ABP25413-ABP30895) from group B streptococcus/GBS (Streptococcus agalactiae) or group A streptococcus/GAS (Streptococcus pyogenes), comprising one of 5483 sequences (S1), given in the specification. The proteins have antibacterial and antiinflammatory activity. (I), nucleic acids encoding (I), ABN66044-ABN71526 and antibodies that bind (I) are used in the manufacture of medicaments for the treatment or prevention of infection or disease caused by Streptococcus bacteria, particularly S. agalactiae and S. pyrogenes. (I) useleic acids encoding (I) are used to detect Streptococcus in a biological sample. (I) is used to determine whether a compound binds to (I). A composition comprising (I) or a nucleic acid encoding (I), may be used as a vaccine or diagnostic composition. The disease caused by Streptococcus that is prevented or treated may be meningitis. Nucleic acid encoding (I) may be used to recombinantly produce (I) and may be used in gene therapy. Antibodies to (I) are used for affinity

The present sequence is that of the coding region of the gene encoding the GapC plasmin binding protein, AgalGapC (see AAM50666), of Streptococcus agalactiae ATCC 27541. The gene was obtained by PCR amplification of chromosomal DNA using the primers given in ABA9133-34.

The invention relates to novel GapC multiple epitope fusion proteins that comprise epitopes from 1 or more of Streptococcus dysgalactiae, Streptococcus agalactiae, Streptococcus dysgalactiae, Streptococcus iniae (see AAM50665-69). A claimed example is PolyGap4 (see AAM50664). The multiple epitope fusion proteins are produced using claimed host-vector systems and used in claimed vaccines for treating or preventing a bacterial infection in a vertebrate, especially a streptococcal infection and particularly mastitis. They are also used in claimed methods of detecting Streptococcus antibodies. The multiple epitope proteins are capable of eliciting broad immunity against a variety of streptococcal infections while minimising the number of antigens present in the final formulation and concomitantly reducing production costs

The present sequence is that of the coding region of the GapC plasmin binding protein gene of Streptococcus agalactiae ATCC 27541. The gene was amplified from chromosomal DNA by PCR using the primers given in ABA91253 plasmid pMF521c. The gene encodes a GapC plasmin binding protein (see plasmid pMF521c. The gene encodes a GapC plasmin binding protein (see AAM50640) that is capable of eliciting an immune response in a creeptococcus species, as well as recombinant vectors, host cells and vaccines compositions comprising GapC polynucleotides or proteins. The vaccines are used to treat or prevent a bacterial infection, especially a streptococcal infection, and mastitis in particular (claimed). A streptococcal infection, and mastitis in sused in a claimed method of treating or preventing a bacterial infection, such as a streptococcal infection, especially mastitis. S. agalactiae is a common pathogen associated with mastitis in cattle, horse, sheep and goat. It also causes septicemia, meningitis, bacteraemia, impetigo, arthritis, urinary tract infections, abcesses, spontaneous abortion, etc

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     \overset{\sim}{\circ}
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to a protein (ABP25413-ABP30895) from group B streptococcus/GBS (Streptococcus agalactiae) or group A streptococcus/GAS (Streptococcus pyogenes), comprising one of 5483 sequences (S1), given in the specification. The proteins have antibacterial and antiinflammatory activity. (I), nucleic acids encoding (I), ABN66044-ABN71526 and antionforces that bind (I) are used in the manufacture of medicaments for the treatment or prevention of infection or disease caused by Streptococcus bacteria, particularly S. agalactiae and S. pyrogenes.

Nucleic acids encoding (I) are used to detect Streptococcus in a biological sample. (I) is used to determine whether a compound binds to (I). A composition comprising (I) or a nucleic acid encoding (I), may be used to recombinantly produce (I) and may be caid encoding (I) may be used to recombinantly produce (I) and may be used in gene therapy. Antibodies to (I) are used for affinity chromatography, immunoassays, and distinguishing/identifying

                                                                                                                                                                                                                                                                                                                                                         ð
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        à
                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to antisense inhibitors of genes essential to prokaryotic cellular proliferation, their use in identifying the genes, their use in the discovery of novel antibiotics, the essential genes their use in the discovery of novel antibiotics, the essential genes themselves and the encoded proteins. The prokaryotes used are Escherichia coli, Staphylococcus aucheus, Salmonella typhi, Klebsiella pneumoniae, seudomonas aeruginosa and Enterococcus faecalis. The invention is also useful for the identification of potential new targets for antibiotic development. The antisense nucleic acids can also be used to identify proteins used in proliferation, to express these proteins, and to obtain antibodies capable of binding to the expressed proteins. The proteins can also useful to screen for homologous nucleic acids equence is also useful to screen for homologous nucleic acids which are required for cell proliferation in a wide variety of organisms. The present sequence for cell proliferation in a wide variety of organisms. The present sequence encodes an essential prokaryotic cellular proliferation protein. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at the printed pot fermines.

                                                                                                                                                                                                                          The present sequence is that of the coding region of the gene encoding the GapC plasmin binding protein, InlaeGapC (see AAM50669), of Streptococcus inlae strain 9117. The gene was obtained by PCR amplification of chromosomal DNA using the primers given in ABA91333-34. The invention relates to novel GapC multiple epitope fusion proteins that comprise epitopes from 1 or more of Streptococcus dysgalactiae, Streptococcus agalactiae, Streptococcus parauberis, Streptococcus uberis and Streptococcus iniae (see AAM50665-69). A claimed example is PolyGap4 (see AAM50664). The multiple epitope fusion proteins are produced using claimed host-vector systems and used in claimed vaccines for treating or preventing a bacterial infection in a vertebrate, especially a
                                                                                                                                                                                                                                                                                                                                                                                              preventing a bacterial infection in a vertebrate, especially a streptococcal infection, and particularly mastitis. They are also used in claimed methods of detecting Streptococcus antibodies. The multiple epitope proteins are capable of eliciting broad immunity against a variety of streptococcal infections while minimising the number of antigens present in the final formulation and concomitantly reducing
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           556

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present sequence is that of the coding region of the GapC plasmin binding protein gene of Streptococcus iniae strain 9117. The gene was amplified from chromosomal DNA by PCR using the primers given in ABA91253 and ABA91254. The PCR product was cloned into expression vector pET15b, creating plasmid pMF521e. The gene encodes a GapC plasmin binding protein (see AAM50643) that is capable of eliciting an immune response in a vertebrate. The invention provides the GapC genes and proteins of 5 Streptococcus species, as well as recombinant vectors, host cells and vaccine compositions comprising GapC polynucleotides or proteins. The vaccines are used to treat or prevent a bacterial infection, especially a streptococcal infection, and mastitis in particular (claimed). A
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Novel isolated GapC protein of Streptococcus dysgalactiae, S.agalactiae, S.uberis, S.parauberis, or S.iniae, useful as vaccine component for treating streptococcal infection which causes mastitis in vertebrates.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      GapC; plasmin-binding protein; infection; mastitis; vaccine; diagnosis
